

Location

Japan is a long, narrow chain of islands stretching 3,300 kilometers north to south. Its northernmost point (in the Russian-occupied Northern Territories) is located at 45°33' north latitude, and its southernmost point is at 20°25' north latitude. The four islands that constitute the main part of Japan lie almost at the latitudinal center of the Northern Hemisphere. Japan's capital, Tokyo, lies at 35°41' north latitude and 139°46' east longitude, almost the same latitude as Tehran, Athens, and Los Angeles.

Cities with Similar Latitudes

Size and Regional Divisions

Japan comprises four major islands—Hokkaido, Honshu, Shikoku, and Kyushu—and 6,848 adjacent smaller islands. Their combined area as of 2006 is 377,921 square kilometers—slightly more than that of Germany (357,022 square kilometers) or Malaysia (329,847) and slightly less than that of Morocco (446,550) or Sweden (449,964). Administratively, the country is divided into 47 prefectures.

Natural Disasters

Several tectonic plates converge beneath the Japanese archipelago, giving rise to frequent earthquakes and volcanic eruptions. The country also sees a fair number of meteorological disasters, such as typhoons and storms. Some major natural disasters in recent years include the July 1990 eruption of Mt. Unzen in Kyushu that resulted in 43 dead or missing, the July 1993 earthquake off the southwestern coast of Hokkaido and the resultant tsunami that left 230 dead or missing, and the January 1995 Great Hanshin Awaji Earthquake that killed more than 6,400 people and destroyed urban infrastructure, including homes, office buildings, roads, railroad tracks, and port facilities, in and around Kobe. Mt. Usu in southwestern Hokkaido erupted in March 2000, for the first time since 1977. Mt. Oyama on Miyake Island, one of the Izu Islands, also resumed volcanic activity in July 2000, and the island's residents were forced to take refuge on the mainland in Tokyo.

The year 2004 will be remembered for a series of natural disasters. An all-time high of 10 typhoons made landfall in Japan, and typhoon No. 23, which hit Japan in October, left 94 persons dead or missing. Heavy rainfall and flooding in July in Niigata, Fukushima, and Fukui Prefectures killed 20 people and damaged over 28,000 dwellings. In October a powerful earthquake hit central Niigata Prefecture, and 67 people were killed, over 4,800 injured, and more than 100,000 residents evacuated. It also caused the derailment of a Shinkansen bullet train for the first time in the line's 40-year history. In March 2005 a big earthquake hit Fukuoka Prefecture, killing one person and injuring over 1,000 people, and another big earthquake hit Noto Peninsula in Ishikawa Prefecture in March 2007, killing one person and injuring more than 300 people.

Destruction Caused by Natural Disasters

	Human casualties		Housing (no. of units)			Farmland ^a (ha)
	Dead or missing	Injured	Totally destroyed	Partially destroyed	Flooded	
1985	105	487	200	542	4,153	38,064
1990	97	425	447	931	26,972	48,908
1995	6,449	43,949	93,312	108,654	3,147	7,349
2000	15	351	537	3,343	24,357	7,478
2004	263	7,773	4,112	28,046	42,897	20,066
2005	45	1,543	1,334	4,001	6,570	13,697
Breakdown for 2005						
Earthquakes, volcanoes	1	1,265	138	318	0	21
